**ASSIGNMENT 3 REPORT : Deploying the Personal Portfolio Website with
Dynamic PHP + MySQL Features**

PREPARED BY:

NO	NAME	MATRIC NUMBER
1	TANG WEI YANG	A24CS5037

1. Introduction

This project builds on Assignment 2 where I created a personal portfolio website that works well on devices using HTML, CSS and JavaScript. In this project I added a feature to the website using PHP and MySQL and then put it online using InfinityFree.

The goal of this project was to get hands-on experience with server-side web development integrating a database and launching a website.

2. Dynamic Feature Implementation

A contact form was added to the portfolio website as a feature that can change. This form lets people visiting the website give their name, email address and a message.

When someone sends and submits the form PHP, the information that was put will save in a MySQL database. The database has a section called `contact_messages` where it keeps all the messages that people have sent so we can look at them later.

The technologies used in this project include:

- HTML5
- CSS3
- JavaScript
- PHP
- MySQL
- InfinityFree Hosting

This feature demonstrates the integration of frontend and backend technologies in a web application.

3. Website Deployment

The website was deployed using InfinityFree, a free web hosting platform that supports PHP and MySQL.

The deployment process base on several steps:

1. Creating an InfinityFree hosting account.
2. Registering a free subdomain for my website.
3. Creating a MySQL database through the hosting control panel.
4. Creating the required database table using phpMyAdmin for my website.
5. Configuring the database connection using PHP for my website.
6. Uploading all my website files to the htdocs directory.
7. Testing the Contact Form and database functionality.

4. Challenges and Solutions

I meet a lot of problems when I was trying to create my website

First,I had to get the database to work right. I fixed this by checking the host and other details that InfinityFree gave me like the username and password and database name.

I had another problem where some pictures and styles were missing after I put the website online. I was able to fix this by looking at the folders and making sure all the files were in the place.

All these problems were really good for me to learn how to fix things when they go wrong with websites.

5. Lighthouse Audit Summary

A Google Lighthouse audit was performed on the homepage of the deployed website to evaluate its overall quality and performance.

Performance	Accessibility	Best Practices	SEO
100	97	100	100

The audit results indicate the website's performance, accessibility, adherence to web development best practices, and search engine optimization readiness.

6. Conclusion

This assignment successfully extended a static portfolio website into a dynamic web application using PHP and MySQL. I used PHP and MySQL to make this happen. The website now has a Contact Form where people can send messages and these messages get stored in a database. This shows that I can handle the behind the scenes work of a website.

I put the website online using InfinityFree. Then I used a tool called Lighthouse to see how good the website is. This project taught me a lot about making a website, managing a database and putting a website online.Overall, the project provided valuable experience in full-stack web development, database management, and website deployment.

WEB PROGRAMMING

In my current studies for Web Programming, I am focused on building a strong foundation in HTML and CSS. These technologies form the core of modern web development, enabling us to structure and style web content effectively. By applying semantic HTML elements and basic CSS styling, I am able to create well-organized, visually appealing, and user-friendly webpages.

Technical Skills

Network Tools: Cisco Packet Tracer, Wireshark, GNS3
Web Tech: HTML5, CSS3, ARIA Roles
Current Project: Driver System (FDS) Case Study
